Perfect score:
                                                      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              seq

This vector has insertion sites for foreign DNA fragments and is capable of autonomous replication. It can be used safely as they remain extrachromosomal and are very stable. They can be used to express homologous or heterologous proteins, which may include antigens for use in vaccines, nutritional, growth and clotting factors, antimicrobials, vitamins (especially vitamin B12), enzymes, hormones and drugs. The propionibacterium host cells are used in the production of animal feeds, manufacture of foodstuffs like, sausages and cheese, where they may be used instead of or in addition to lactic acid bacteria and in the manufacture of vitamin B12. This sequence can also be used as a source of primers and probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cc plasmid pAL 5000 origin of replication, ori which has been derived by PCR callysis. This sequence is used in a method which results in the correction of Mycobacterium recombinant vaccines from compositions that provide a continuous source of protein to an animal and stimulate cc cellular immunity. Such compositions are used to stimulate cellular continuous source of protein to an animal and stimulate continuous source of protein to an animal and stimulate cellular standing the cellular particularity (by inducing Th-1 cells or cytotoxic T lymphocytes), particularly as vaccines (live or dead) for treating and preventing cc diseases caused by intracellular pathogens (bacteria, viruses, rickettsia or protozoa), and also cancer, autoimmune diseases, allergy and bovine compositorm encephalitis, in humans or animals. The vaccines are cadministered by injection, orally and nasally. These compositions provide consistent and long-lasting immunity. Transformed cells used in the method are retained within macrophages, blocking the killing mechanism but producing protective immunogen which is processed and presented by the macrophage. Several immunogens may be included in the same vaccine and the Mycobacterium cells serve as adjuvant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                           vaccines from compositions that provide a continuous source of protein to an animal and stimulate cellular immunity. Such compositions are used to stimulate cellular immunity (by inducing Th-1 cells or cytotoxic T lymphocytes), particularly as vaccines (live or dead) for treating and preventing diseases caused by intracellular pathogens (bacteria, viruses, rickettsia or protozoa), and also cancer, autoimmune diseases, allergy and bovine spongiform encephalitis, in humans or animals. The vaccines are administered by injection, orally and nasally. These compositions provide consistent and long-lasting immunity. Transformed cells used in the method are retained within macrophages, blocking the killing mechanism but producing protective immunogen which is processed and presented by the macrophage. Several immunogens may be included in the
                                                                                                                                                                                                                                                          This genomic DNA sequence contains is the Mycobacterium fortiutum plasmid pAL 5000 origin of replication, ori. This sequence is used in a method which results in the formation of Mycobacterium recombinant
                                                                                                                                                                                                                                                                                                                                                               Recombinant non-pathogenic Mycobacterium as vaccines providing long term cellular immunity - useful against intracellular pathogens, cancer and autoimmune disease, and are retained in host macrophages
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Origin of replication; vaccine; cellular immunity; Th-1 cell; cance cytotoxic T lymphocyte; treatment; prevention; disease; autoimmune; intracellular pathogen; allergy; bovine spongiform encephalitis; BS macrophage; immunogen; adjuvant; ds.

                                                                                                                                                                                                                                                                   This sequence represents the plasmid pMV101. This plasmid was used in the construction of a series of vectors used to produce the recombinant Mycobacteria of the invention. The recombinant mycobacteria of the invention are transformed with DNA encoding a polypeptide which comprises a lipoprotein secretion signal sequence and an antigen (Ag) heterologous to the mycobacteria. The lipoprotein secretion signal causes the Ag to be produced as a lipoprotein. The mycobacteria may be used in the form of a live bacterial vaccines against Lyme disease, where the bacterial express a surface protein of Borrelia burgdorferi, the causative agent of Lyme disease.
                                                                                                                                         2852
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mycobacteria expressing secretion signal of lipoprotein and heterologous antigen, esp. outer surface protein A or B of Borrelia burgdorferi - are used in the form of a live bacterial vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 1997-042315/04.

A multiple cloning site was synthesised. The cassettes were constructed to allow directional cloning and assembly into a plasmid where all transcription is unidirectional. Plasmid pMY206 was derived from plasmid pMV204 which was made up of all the cassettes. It was modified by the insertion of an Mull-NotI linker between the M.rep and E.rep cassettes to facilitate removal of
